BIO-BASED RESINS

Next-Generation Solutions for Sustainable Composites

Today, the environmental impact of fossil-based raw materials is more evident than ever, making the shift toward sustainable solutions in the composites and thermoset resin industry an absolute necessity. Our **Bio-based Resins** are engineered to significantly **reduce carbon footprints** by utilizing renewable raw materials. By incorporating these sustainable raw materials, we deliver **high-performance solutions** that meet rigorous industrial expectations without sacrifice.

Why Bio-Based Resins?

These systems are developed in direct alignment with global sustainability goals and circular economy principles. Unlike traditional fossil-based options, they offer a significantly lower carbon footprint and utilize environmentally responsible formulations.

Key Features

Renewable Chemistry: Formulated using bio-based dicarboxylic acids and diols derived from plant sources and agricultural co-products.

Styrene Alternatives: Integration of environmentally friendly vinyl monomers to replace traditional styrene.

Resource Efficiency: Advanced molecular design that reduces environmental impact while improving production efficiency.

Evolving Performance: Ongoing R&D ensures an optimal balance of mechanical and thermal properties that rapidly close the gap with fossil-based systems.

Applications

- Automotive and transportation components.
- Construction, infrastructure, and marine environments.
- Energy sector and wind turbine manufacturing.

Sustainable Chemistry
Uncompromised Performance
