VINYL ESTER RESINS

Bridging the Gap Between Strength and Durability

Our Vinyl Ester Resins meet the most aggressive performance demands of modern industry by combining **chemical resistance**, mechanical strength and ease of process. By bridging the gap between epoxy and polyester systems, our technology ensures **long service life** and **production continuity** in environments where standard resins fail.

Our product range, developed for different process requirements, is fully compatible with hot or cold open mold and closed mold manufacturing methods.

Why This System?

This system offers superior resilience by blending the high-performance mechanical properties of epoxies with the fast-curing and versatile processing advantages typically found in polyester resins.

Key Features

BPA-Based Series (V75-V76): High-strength resistance to acids and solvents for general-purpose industrial safety.

DCPD-Modified (V77): Ideal for large-volume parts, offering low exotherm and reduced cracking risk.

Urethane-Modified (V78): Engineered for extreme flexibility, impact resistance, and thermal shock protection.

Novolac-Based (V85): The ultimate solution for extreme chemical and thermal environments.

SMC-Compatible (V90): Optimized for high-performance series production with homogeneous surface quality.

Applications

- Chemical and petrochemical storage tanks and linings.
- Automotive, marine, and high-impact structural components.
- Wind energy and high-performance industrial flooring.
